Policy distance from oracle: aggregation is more sensitive and smoother
$\|y^*(\lambda) - y^*(\lambda_{true})\|_1$
Original LP (S=56)
State Agg (M=10)

Gradient magnitude: smooth steering provides non-zero baseline; LP response adds spikes at basis changes
$\|dy/d\lambda\|_1$ (exact)
Original LP: $\|dy^*/d\lambda\|_1$
State Agg total: $\|d\tilde{y}/d\lambda\|_1$
Smooth steering: $\|dW/d\lambda \cdot y^*_{agg}\|_1$
LP response: $\|W \cdot dy^*_{agg}/d\lambda\|_1$
